Geo Excel redesign: problem and solution

The problem

Geo Excel (Geoexcel Production Trades Pvt Ltd, Bangalore) exports rice, spices, frozen vegetables and oils, and holds real exporter registrations. A buyer who lands on the current site cannot get from "*what do they sell and can I trust them?*" to "*send an enquiry*". The site has the content, but no conversion path.

Supporting observations (live site, audited 30 Oct 2026)

#	Observation	Evidence
1	**No enquiry path from product pages.** The 5 product pages (4 with specs for about 46 products and HS codes) contain 0 forms, 0 `mailto:`, 0 `tel:`, 0 CTAs. The nav item "Contact" links back to the homepage.	Playwright DOM extraction; `audit/screenshots/general-9-desktop-fold.jpg`
2	**One generic form, weak CTA.** 4 fields, only email required; no company, country, product or quantity. The hero CTA "Get Started" goes to the product grid, not the form.	`audit/crawl.json` (home); `home-desktop.jpg`
3	**Value proposition is missing.** H1 reads "GEO EXCEL / FOR YOUR BUSINESS". Nothing says what is sold, to whom or from where.	`audit/content/home.txt`
4	**Proof is buried.** Credentials are 5 scanned images with no text and 7 H1s. What each covers (APEDA: frozen potato products; Leather Council: leather footwear; FSSAI: trader/exporter) is readable only inside the image. 13 of 15 homepage images lack alt text; two certificates print past validity dates.	`certificates-desktop.jpg`; full-resolution certificate scans
5	**Amplifiers.** At 390 px every page is 980 px wide (layout cropped); Lighthouse mobile performance 25, LCP 17.2 s. Every page carries `noindex` and the sitemap returns 404, so new buyers are unlikely to find it.	`home-mobile-fold.jpg`; `audit/lighthouse/home.json`; page source

Full ranked list of 12 findings: `audit/FINDINGS.md`. Benchmarks (LT Foods, Kohinoor Foods) show comparable exporters state what/where in the hero, show proof as text, and offer a named quote route with product selectors.

How the redesign addresses it

1. **State the offer** in the first screen: "Indian rice, spices, frozen vegetables & oils, exported to order", with the registered company name and two actions: *Request a quote* and *Browse 44 products*.
2. **Make proof readable and honest.** A registrations strip and a Credentials page give issuer, scope, issued and valid-to dates as printed, beside each certificate copy. Expired-looking dates are flagged, not hidden. No clients, numbers or testimonials are invented.
3. **Turn the catalogue into a quote tool.** 44 spec-sheet pages with a photo, filter and search; every product has *Add to enquiry* and *Quote this product now*; the header shows the count, and Home / back-to-category links keep navigation easy.
4. **A structured enquiry that is captured, not just emailed.** The form arrives pre-filled with the selected products, each with its own spec choices, and saves a customer, a numbered quotation (e.g. GX-2026-0001) and its items in a Supabase database. The visitor gets the reference; the team gets a private **admin inbox** (and an email alert once the mail secrets are set) (status: new, in review, quoted, won, lost, closed; internal notes; customer history), so no enquiry depends on someone's mailbox and every one can be followed up and counted.
5. **Remove the amplifiers:** responsive from 390 px, indexable, with unique titles and descriptions, one H1 per page, sitemap, canonical and OG tags. Local Lighthouse: mobile 100/100/100/100 (performance/accessibility/best practices/SEO), LCP 1.0 s, versus 25/100/77/54 and 17.2 s on the live site.

How success would be measured

Baselines do not exist (no analytics access), so the first step is to instrument the current site for 2-4 weeks.

- **Primary:** qualified enquiries per 100 visits (a stored quotation with company, destination and at least one product).
- **Follow-up (now measurable from the admin data):** share of quotations moved past "new" within a working day, quoted-to-won rate, enquiries per product line.
- **Funnel:** share of product views that add to enquiry; share of enquiry-page views that submit; share of enquiries naming a product and quantity.

- **Reach:** indexed pages and non-branded impressions in Search Console; mobile share of sessions and mobile conversion rate.
- **Quality:** enquiries that need no follow-up question, and enquiries per product line.
- **Guardrails:** Lighthouse mobile ≥ 90, zero broken links in CI.

What I would do next

1. Replace placeholders with real data: current certificates, verified product specifications (the catalogue is SAMPLE until then), owned photography, and set the email secrets so alerts reach the right inbox from a verified domain.
2. Have the company correct the product data errors listed in the README, and confirm which products each registration actually covers.
3. Add analytics (privacy-friendly) and Search Console; verify the `noindex` flag was unintended before any launch on the live domain.
4. Add only what the company can document: markets served, sample/lead-time policy, packing and documentation list, named references with permission.
5. Interview 3-5 real buyers or the sales team to learn the questions asked before ordering, and test the form with them.

Scope note: this is a concept built from public information. Everything not publicly verifiable is marked as placeholder in the code and README.
